Had the brightness function buttons worked...but the solution is very simple.

Just add `acpi_backlight=vendor` to the boot loader and the brightness buttons will now work as intended, controlling the backlight.

This will also apply to other Samsung Netbooks/Laptops.

On the subject of openSUSE 12.2, I have to say it is a very nice release.

Everything seems to be working, it is fast and nippy!

The two months of extra stabilisation have really paid off.
