Linux Foundation Executive Director Jim Zemlin is likely one of a handful of people in the world who has had a front row seat to the largest collaborative development effort in the history of computing, Linux. He understands that speed of innovation and quality of software development is dictated by forward thinkers who are working in collaboration.

That is why he was recently invited to speak at TEDx about what the technology industry has learned from Linux, and specifically its creator Linus Torvalds, and how some of those lessons can be applied to a variety of efforts and projects across geographies and disciplines.

Linux has been pretty successful and the TEDx audience was eager to learn how it has achieved such success and how they could apply some of the Linux community's best practices to their own work. In true Zemlin style, the lessons seemed a little surprising at first but as he elaborated, the audience soon understood how Linux has become the largest shared technology resource known to man. It runs the Internet, our smartphones, televisions, the world's high performance computing systems and eight out of 10 of the world's stock exchanges. It's literally the foundation for our global economy, he explained.
