or the last few months, we've been raising an outcry against Encrypted Media Extensions (EME), a plan by Netflix and a block of other media and software companies to squeeze support for Digital Restrictions Management (DRM) into the HTML standard, the core language of the Worldwide Web. The HTML standard is set by the World Wide Web Consortium (W3C), which this block of corporations has been heavily lobbying as of late.

The proposed adoption of EME is disturbing for what it says about the way decisions are made relative to the Web, but what does it mean for you as a free software user?

DRM and free software don't mix. All DRM software relies on keeping secrets, like decryption algorithms, from the user, so that users cannot design their own method to modify it. The secrets are stored on users' own computers in places users cannot access or even read. This practice inherently tramples Freedom 1 of the Free Software Definition: the freedom to study how a program works and change it so it does your computing as you wish.
