I moved to Kubuntu early Sunday morning, and it was not without a few minor perils. I wanted a clean install, thus formatting /home was a must. I was coming from Linux Mint 14 XFCE to Kubuntu 13.04 which of course uses KDE as the default desktop manager. I really didn't want any cross contamination in /home nor did I want to dual-boot. It was all in or nothing. So I chose the all in and I am glad I did.

I want to first talk about the install and we will get to the minor perils later. The installer uses a very simple but efficient interface and for me was really quick including updates, (An option during the install.). I went with the manual option and reused the partitions already in place, but as mentioned above, I did format all of them except for /swap. The first boot was very fast to the desktop. Something I did not expect at all was that my Atheros wired connection was up and running with the alx driver. I wrote about having to build the kernel module for this driver in the past.
