Everyone knows that keeping regular backups of our data is the No. 1 best insurance against mishaps. The No. 2 best insurance is smart partitioning on your Linux PC that puts your data on a different partition from the root filesystem. Having a single separate data partition is especially useful for distro-hoppers, and for multi-booting multiple distros; all your files are in one place, and protected from mad installation frenzies. And why not distro-hop and multi-boot random distros? Unlike certain inexplicably popular expensive fragile, low self-esteem proprietary operating systems it's easy and fun. No hoops to jump, no blurry eleventy-eight digit registration numbers, no mother-may-I, no phoning your activities home to the mother ship: just download and start playing.
