Say what you want about web browsers on Linux, I just miss Internet Explorer. No let's be serious. A great thing about Linux distributions is in general that they come packaged with a good browser. If that browser is not your favorite, you can easily install another one (and you don't necessarily need a browser to download your favorite browser). For most users, however, this favorite browser will be Chrome or Firefox, and there are reasons for that: they are both good browsers. For more adventurous users, there is also Opera, which recently improved. But, there exist browsers out there which are a lot more exotic, with particular features and goals. I shall propose you eight examples: eight browsers which may not be as complete as Chrome or Firefox, but which are definitely worth checking out for their philosophies or design.
