I can easily name five distros that have brought some massive changes to the way we interact with our computers?and not all of them on the good side of my list. A more pertinent question might be, which Linux distros are in it for the long haul?

One of the biggest advantages, and an often-perceived disadvantage, is the overwhelming number of choices in the Linuxsphere. I could give a good argument either way if I were pushed into it, but what it comes down to is stability.
