I noticed that the icons were new and the DE is more responsive than the beta that I had installed previously. I particularly loved the new icon for the Mageia Control Center (it reminded me of the nazar in Pisi Linux).

I used the system a bit to see if I could detect certain glitches even though I know this is not a final version. My intention is not to write a review, but to assess potential problems and, most importantly, to get more familiar with Mageia running Plasma 5.

My HP Pavilion has been running OpenMandriva 2014 exclusively, but I decided to upgrade it to OpenMandriva Lx 3 last week.
